

Types of Functions

Piecewise Functions

Notation

$$f(x) = \begin{cases} \text{function,} & \text{condition} \\ \vdots & \vdots \\ \text{function,} & \text{condition} \end{cases}$$

Example:

$$f(x) = \begin{cases} x, & [0, 2) \\ \frac{1}{2}x, & (2, 6] \\ \frac{3}{5}x, & (6, 9] \\ -x, & (9, 15] \end{cases}$$

Example:

Absolute Value

Example:

Example:

Even and Odd

Definition:

A function $f(x)$ is called:

Even: If $\forall x \in D$ we have $f(-x) = f(x)$

Odd: If $\forall x \in D$ we have $f(-x) = -f(x)$

Neither:

Symmetries:

Even:

Odd:

Neither:

Increasing Decreasing

Definition:

A function $f(x)$ on an interval I is called:

Increasing: $\forall a, b \in I$ if $a < b$ then $f(a) < f(b)$

Decreasing: $\forall a, b \in I$ if $a < b$ then $f(a) > f(b)$
